Abstract

Introduction

In our project, we examined the whether gender discrimination existed in setting salaries for people in the academia or higher education institutions.

Exploratory data analysis

Data used in our studies were collected from 261 individuals who work in the academia or higher education institutions. The raw dataset contains following features.

- **Dept:** 1= Biochemistry/Molecular Biology 2= Physiology 3= Genetics 4= Pediatrics 5= Medicine 6= Surgery
- **Gender:** 1= Male, 0= Female
- **Clin:** 1= Primarily clinical emphasis, 0= Primarily research emphasis
- **Cert:** 1= Board certified, 0= not certified
- **Prate:** Publication rate (# publications on cv) / (# years between CV date and MD date)
- **Exper:** # years since obtaining MD
- **Rank:** 1= Assistant, 2= Associate, 3= Full professor (a proxy for productivity)
- **Sal94:** Salary in academic year 1994
- **Sal95:** Salary after increment to Sal94

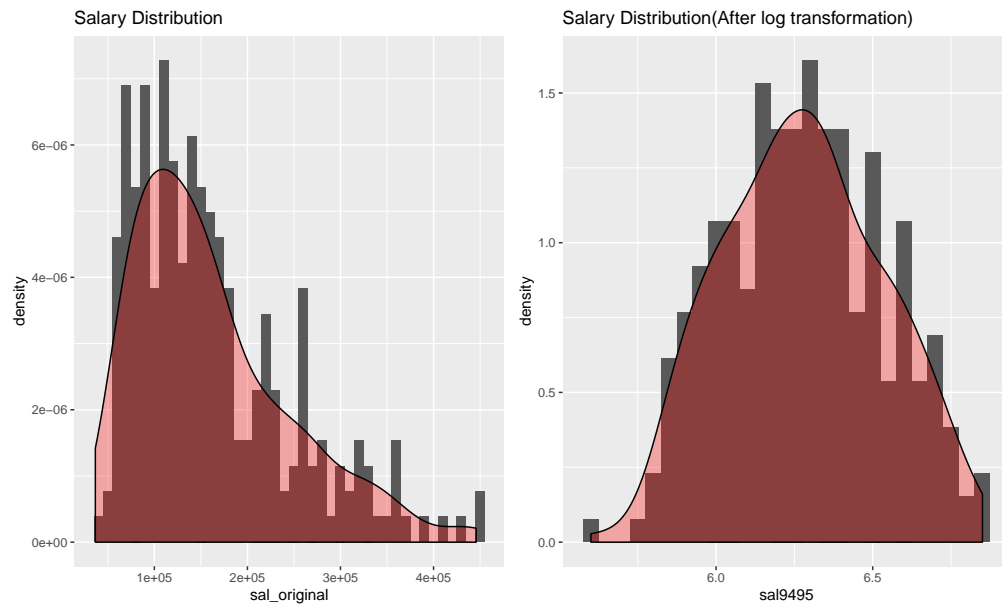

Table 1 contains the summary of variables in the dataset. Fortunately, there are no missing values in our dataset.

We then need to examine each interested variable against the main effect and main interest.

Salary

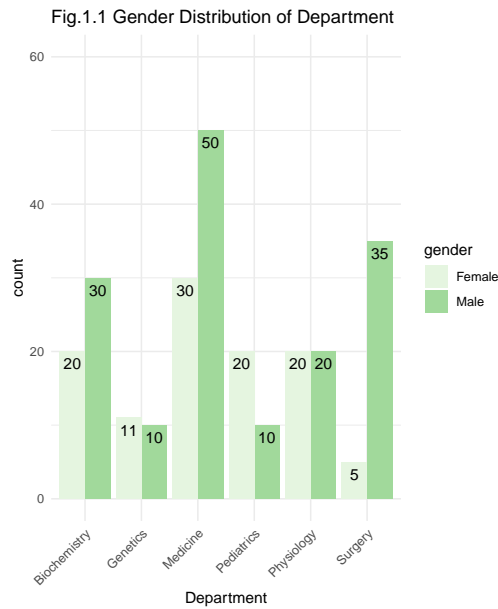

Since $\lambda = 0$, we use log transformation.

Department

Fig 1.1. shows that the gender ratios in the department of Genetics and Physiology are very balanced, compared with department of Medicine and Surgery, which are very imbalanced. The differences in department of Biochemistry and Pediatrics are moderate. Fig 1.2 includes our main interest the salary into account. It seems that across all department, male earn more than female do. However, before further analysis, we cannot tell whether those difference are significant.

Clinical or Research Division

Fig 2.1 shows that in either division, there are more male than female, especially the clinical division. Regarding salary, again, male in either division earned more than female do.

Certification status

Fig.3. shows that the amount of certified male outnumbers surely the amount of certified female. However, for those without certification, those are just even. For the salary, male again earn more than female do regardless of his or her certification status.

Prate

Fig 4.1 shows the density plot of publication rate for both male and female. No obvious difference was observed.

Fig 4.2 implies that there might be linear trend between average salary and publication rate. However, it's hard to tell whether there is any difference on the effect on the salary regarding the gender.

Exper

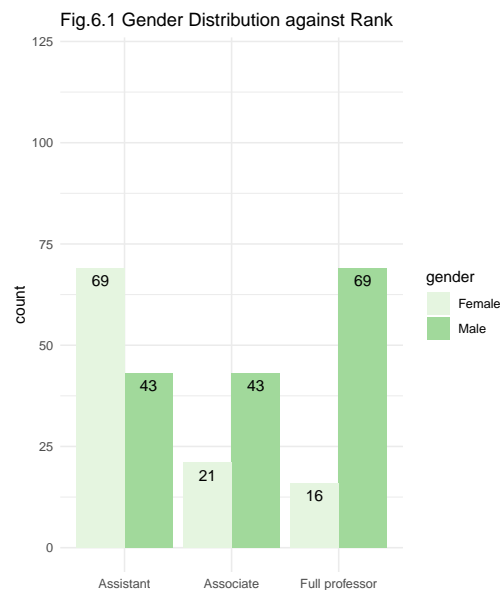

Fig.5.1 shows that the densities of experience year for both male and female are both very skewed, and seems that female have a more skewed trend. Although there are not obvious linear trend between salary and experience

year, the salary for male spread more widely than those for female and individual with high salary are dominately male.

Rank

Fig 6.1 shows that there are many female assistant professor and less associate and full professor than male. Without surprising, in either rank, male earn more than female.

Lastly, after examining the correlation matrix, we can see that there are some highly related variables ($r > 80\%$). They are 1. Department (Dept) and Publish Rate (Prate) and 2. Clin and Prate. Some have morderate correlation such as 1. Experience Year (Exper) annd Cert (Certification status) and 2.Department (Dept) and Clin.

Those imply potential collinearities. As we go through those variables, there are some outliers. In later section, we will examine further about them.

Method

```
##

```

There is no need to consider prate since the correlation of prate and dept is -0.87. Otherwise there might be collinearity.

From linear regression results, rank is not significant. From partial F test, p is more than 0.05, which shows that model with rank is not superior.

Since the changes of estimate of genderMale are more than 10% and all p-values from partial F test are less than 0.05, dept, clin, cert and exper are all confounders. So we need to add these covariates into the model.

First we need to add department....

```

Result:

p value of partial F test is more than 0.05, which shows that the model adding cert is superior. Therefore, we need to add cert in the model.
